What is claimed is:

5

10

20

25

30

- A position control system for a remote-controlled vehicle, the system comprising:
 an electromagnetic energy receiver configured to receive an electromagnetic
 beam and further configured to generate a control signal indicative of a
 position of the remote-controlled vehicle relative to a position of the
 electromagnetic beam;
 - a propulsion system; and
 - a positioning control system configured to receive the control signal and maneuver the remote-controlled vehicle by directing the propulsion system in response the control signal.
- 2. The system of Claim 1, wherein the electromagnetic energy receiver includes at least one photoelectric cell configured to generate electrical power when subjected to application of electromagnetic energy.
 - 3. The system of Claim 2, wherein the photoelectric cell includes a solar cell.
- 15 4. The system of Claim 1, wherein the electromagnetic energy receiver is configured to receive an externally-applied laser signal.
 - 5. The system of Claim 1, wherein the electromagnetic energy receiver includes an electromagnetic receiving array including a plurality of electromagnetic sensors, each of the electromagnetic sensors being configured to generate a sensor output indicative of an intensity of electromagnetic energy received by the electromagnetic sensor.
 - 6. The system of Claim 5, wherein the control signal includes the sensor output of each of the electromagnetic sensors.
 - 7. The system of Claim 6, wherein the positioning control system is further configured to generally equalize the sensor output of each of the electromagnetic sensors by maneuvering the remote-controlled vehicle such that the electromagnetic beam is received toward a center of the electromagnetic receiving array.
 - 8. The system of Claim 7, wherein the positioning control system is further configured to maneuver the remote-controlled vehicle relative to the source of the electromagnetic beam such that the remote-controlled vehicle maintains a predetermined distance from the source of the electromagnetic beam.

- 17 -

- The system of Claim 8, wherein the positioning control system is further configured to receive external commands for adjusting a response to the electromagnetic beam.
- The system of Claim 1, wherein the remote-controlled vehicle includes an airborne vehicle.
- 5 The system of Claim 10, wherein the positioning control system is further configured to maintain the airborne vehicle at a level attitude.
 - The system of Claim 10, further comprising a propulsion system including at least one rotor disposed to generate lift.
- The system of Claim 12, wherein the propulsion system includes a plurality of individually controllable lift rotors, each of the individually controllable lift rotors being 10 further configured to generate a variable quantity of thrust such that a composite thrust of the plurality of individually controllable lift rotors provides at least one of a lift and a thrust component in a direction generally perpendicular to the lift.
- The system of Claim 10, wherein the propulsion system includes at least one rotor 15 disposed to generate thrust in a direction generally perpendicular to the lift.
 - The system of Claim 10, wherein the airborne vehicle includes a hovering vehicle configured to generate sufficient lift to support the airborne vehicle aloft.
 - The system of Claim 10, wherein the airborne vehicle includes a lighter-than-air 16. vehicle.
- 20 17. The system of Claim 1, wherein the remote-controlled vehicle includes a land-based vehicle.
 - The system of Claim 1, wherein the remote-controlled vehicle includes a waterbased vehicle configured to operate at least one of on the surface or under the surface of a body of water.
- 25 19. The system of Claim 1, wherein the remote-controlled vehicle includes a spacebased vehicle configured to operate in at least a partial vacuum.
 - The system of Claim 1, further comprising at least one surveillance device configured to capture data from the perspective of the remote-controlled vehicle.

BLACK LOWE & GRAHAM ~~

- 18 -

- The system of Claim 20, wherein the surveillance device is configured to transmit telemetry to a telemetry station.
- 22. The system of Claim 21, wherein the surveillance device is remotely controllable from a control station.
- The system of Claim 22, wherein the surveillance device includes at least one of a 5 camera, a microphone, a chemical sensor, a biological sensor, a radiation detector, and an environmental sensor.
 - The system of Claim 1, further comprising at least one relay device configured to relay an electromagnetic signal.
- 10 The system of Claim 24, further comprising a movable base, wherein the movable base is configured to adjust a position of the relay device.
 - The system of Claim 24, wherein the electromagnetic relay device includes a reflector configured to relay the electromagnetic signal.
 - 27. The system of Claim 26, wherein the relay device includes a mirror.
- 15 The system of Claim 24, wherein the electromagnetic relay device includes a signal repeater configured to receive and resend an electromagnetic signal.
 - The system of Claim 28, wherein the electromagnetic relay device includes a microwave relay.
- 30. The system of Claim 24, wherein electromagnetic signal communications signal. 20
 - The system of Claim 24, wherein the electromagnetic signal includes an energy weapon beam.
 - The system of Claim 31, wherein the energy weapon beam includes a high-powered laser signal.
- 25 The system of Claim 1, further comprising a payload delivery mechanism.
 - 34. A remote-controlled vehicle comprising: a vehicle housing;

- an electromagnetic energy receiver mounted on the vehicle housing, the electromagnetic energy receiver being configured to receive an electromagnetic beam and further configured to generate a control signal indicative of a position of the remote-controlled vehicle relative to a position of the electromagnetic beam;
- a propulsion system mounted on the vehicle housing; and
- a positioning control system configured to receive the control signal and maneuver the remote-controlled vehicle by directing the propulsion system in response the control signal.
- 35. The vehicle of Claim 34, wherein the electromagnetic energy receiver includes at least one photoelectric cell configured to generate electrical power when subjected to application of electromagnetic energy.
 - 36. The vehicle of Claim 35, wherein the photoelectric cell includes a solar cell.
- 37. The vehicle of Claim 34, wherein the electromagnetic energy receiver is configured to receive an externally-applied laser signal.
 - 38. The vehicle of Claim 34, wherein the electromagnetic energy receiver includes an electromagnetic receiving array including a plurality of electromagnetic sensors, each of the electromagnetic sensors being configured to generate a sensor output indicative of an intensity of electromagnetic energy received by the electromagnetic sensor.
- 39. The vehicle of Claim 38, wherein the control signal includes the sensor output of each of the electromagnetic sensors.
 - 40. The vehicle of Claim 39, wherein the positioning control system is further configured to generally equalize the sensor output of each of the electromagnetic sensors by maneuvering the remote-controlled vehicle such that the electromagnetic beam is received toward a center of the electromagnetic receiving array.
 - 41. The vehicle of Claim 40, wherein the positioning control system is further configured to maneuver the remote-controlled vehicle relative to the source of the electromagnetic beam such that the remote-controlled vehicle maintains a predetermined distance from the source of the electromagnetic beam.

- 42. The vehicle of Claim 41, wherein the positioning control system is further configured to receive external commands for adjusting a response to the electromagnetic beam.
- 43. The vehicle of Claim 34, wherein the remote-controlled vehicle includes an airborne vehicle.
 - 44. The vehicle of Claim 43, wherein the positioning control system is further configured to maintain the airborne vehicle at a level attitude.
 - 45. The vehicle of Claim 43, further comprising a propulsion system including at least one rotor disposed to generate lift.
- 46. The vehicle of Claim 45, wherein the propulsion system includes a plurality of individually controllable lift rotors, each of the individually controllable lift rotors being further configured to generate a variable quantity of thrust such that a composite thrust of the plurality of individually controllable lift rotors provides at least one of a lift and a thrust component in a direction generally perpendicular to the lift.
- 15 47. The vehicle of Claim 43, wherein the propulsion system includes at least one rotor disposed to generate thrust in a direction generally perpendicular to the lift.
 - 48. The system of Claim 43, wherein the airborne vehicle includes a hovering vehicle configured to generate sufficient lift to support the airborne vehicle aloft.
- 49. The system of Claim 43, wherein the airborne vehicle includes a lighter-than-air vehicle.
 - 50. The vehicle of Claim 34, wherein the remote-controlled vehicle includes a land-based vehicle.
- 51. The vehicle of Claim 34, wherein the remote-controlled vehicle includes a water-based vehicle configured to operate at least one of on the surface or under the surface of a body of water.
 - 52. The vehicle of Claim 34, wherein the remote-controlled vehicle includes a space-based vehicle configured to operate in at least a partial vacuum.

- 53. The vehicle of Claim 34, further comprising at least one surveillance device configured to capture data from the perspective of the remote-controlled vehicle.
- 54. The vehicle of Claim 53, wherein the surveillance device is configured to transmit telemetry to a telemetry station.
- 5 55. The vehicle of Claim 54, wherein the surveillance device is remotely controllable from a control station.
 - 56. The vehicle of Claim 55, wherein the surveillance device includes at least one of a camera, a microphone, a chemical sensor, a biological sensor, a radiation detector, and an environmental sensor.
- 10 57. The vehicle of Claim 34, further comprising at least one relay device configured to relay an electromagnetic signal.
 - 58. The vehicle of Claim 57, further comprising a movable base, wherein the movable base is configured to adjust a position of the relay device.
- 59. The vehicle of Claim 57, wherein the electromagnetic relay device includes a reflector configured to relay the electromagnetic signal.
 - 60. The vehicle of Claim 58, wherein the relay device includes a mirror.
 - 61. The vehicle of Claim 57, wherein the electromagnetic relay device includes a signal repeater configured to receive and resend an electromagnetic signal.
- 62. The vehicle of Claim 61, wherein the electromagnetic relay device includes a 20 microwave relay.
 - 63. The vehicle of Claim 57, wherein electromagnetic signal includes a communications signal.
 - 64. The vehicle of Claim 57, wherein the electromagnetic signal includes an energy weapon beam.
- 25 65. The vehicle of Claim 64, wherein the energy weapon beam includes a high-powered laser signal.
 - 66. The vehicle of Claim 34, further comprising a payload delivery mechanism.

BLACK LOWE & GRAHAM PLLC

67. A method for positioning a remote-controlled vehicle at a desired aerial location, the method comprising:

receiving an electromagnetic beam;

5

10

detecting a position of the remote-controlled vehicle relative to a position of the electromagnetic beam; and

maneuvering the remote-controlled vehicle to follow the electromagnetic beam to the desired position.

- 68. The method of Claim 67, wherein the electromagnetic beam is received using at least one photoelectric cell configured to generate electrical power when subjected to application of electromagnetic energy.
 - 69. The method of Claim 68, wherein the photoelectric cell includes a solar cell.
- 70. The method of Claim 69, wherein receiving the electromagnetic beam includes receiving an externally-applied laser signal.
- 71. The method of Claim 67, wherein the remote-controlled vehicle is maneuvered to follow the electromagnetic beam using a plurality of electromagnetic sensors, each of the electromagnetic sensors generating a sensor output indicative of an intensity of electromagnetic energy received by the electromagnetic sensor from the electromagnetic beam.
- 72. The method of Claim 71, further comprising maneuvering the remote-controlled vehicle to generally equalize the sensor output of each of the electromagnetic sensors such that the electromagnetic beam is received generally evenly by the electromagnetic sensors.
 - 73. The method of Claim 72, further comprising maneuvering the remote-controlled vehicle relative to the source of the electromagnetic beam such that the remote-controlled vehicle maintains a predetermined distance from the source of the electromagnetic beam.
- 25 74. The method of Claim 73, further comprising receiving external commands to adjust a response of the remote-controlled vehicle to the electromagnetic beam.
 - 75. The method of Claim 67, wherein the remote-controlled vehicle includes an airborne vehicle.

BLACK LOWE & GRAHAM PLLC

- 76. The method of Claim 75, wherein the airborne vehicle includes a hovering vehicle configured to generate sufficient lift to support the airborne vehicle aloft.
- 77. The system of Claim 75, wherein the airborne vehicle includes a lighter-than-air vehicle.
- 5 78. The method of Claim 67, wherein the remote-controlled vehicle includes a land-based vehicle.
 - 79. The method of Claim 67, wherein the remote-controlled vehicle includes a land-based vehicle.
- 80. The method of Claim-67, wherein the remote-controlled vehicle includes a water-10 based vehicle configured to operate at least one of on the surface and under the surface of a body of water.
 - 81. The system of Claim 67, wherein the remote-controlled vehicle includes a space-based vehicle configured to operate in at least a partial vacuum.
